

#### **Student Name:**

Group no.:

#### **Course Date:**

# **OBJECTIVES**

 Knowledge: To understand the fluvial processes with the characteristics of the river courses. To analyze how human factors affect the fluvial process and water quality. To study the management strategies of river systems.
 Skill: To use different equipment to collect data of channel characteristics and water quality and conduct laboratory work.

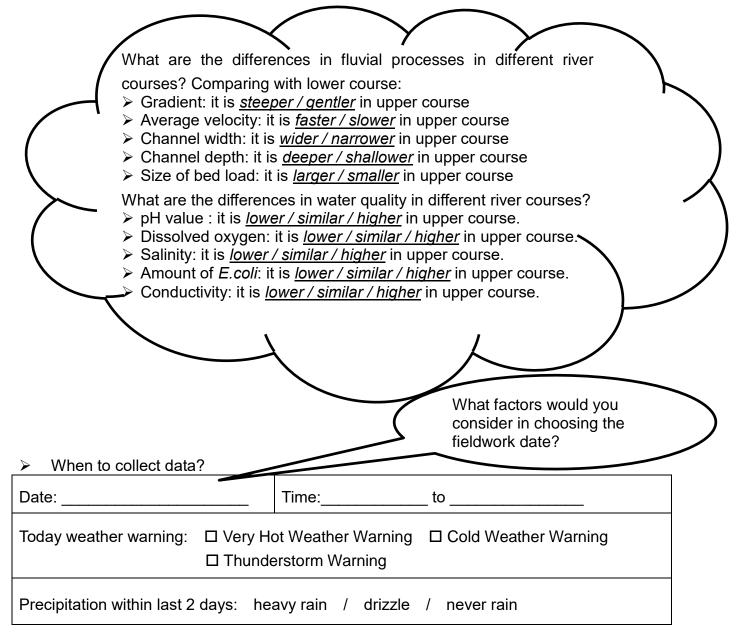

- To draw the cross section.
- Value To concern the effects of urban encroachment on rural environment.
   To aware the importance of water quality to water resources of China and H.K.

### **Relevance to the DSE geography curriculum**

Managing River Environment: A continuing challenge

### Stage1: Planning & Preparation

- Key point of fieldwork: The differences of fluvial processes and water quality in different river courses.
- My hypothesis: based on upper, middle and lower courses

> Where to collect data?

| River: | River Silver  | Wang Tong                 |
|--------|---------------|---------------------------|
| Site:  | A / B / C / D | E / F / G / H             |
|        | What fac      | tors should be considered |

in choosing filed sites?

> What data to be collected?

Refer to p. 4 and match the appropriate primary data collection methods and equipment to the research items.

| Research items   | Primary data<br>collection<br>methods | Required<br>equipment / Tool<br>(if any) | Need to take<br>sample?<br>$(\sqrt{x})$ | Operational<br>precaution<br>s |
|--|---------------------------------------|--|---|--------------------------------|
| Fluvial processes & chara  | acteristics                           |  |   |                                |
| Cross section of channel<br>(include channel width and<br>depth) |                                       |  |   |                                |

|                       | Area                           |                | Total no. of square(s) |
|-----------------------|--------------------------------|----------------|------------------------|
| A complete square:    | X=                             | m²             |                        |
| An incomplete square: | Area of a complete square/ 2 = | m <sup>2</sup> |                        |

The channel cross-sectional area is \_\_\_\_\_m<sup>2</sup>

Another method to calculate the channel cross-sectional area:

Channel width(m) X Average Channel depth (m) =  $_m X _m = _m^2$ 

Calculate the river discharge by using the channel data collected. Show your calculation steps.

• The river discharge = velocity (m/s)\* X cross section area (m<sup>2</sup>)

= \_\_\_\_\_ m<sup>3</sup>/s

\* refer to p.7

#### Channel Gradient

 $\checkmark$ 

 $\checkmark$ 

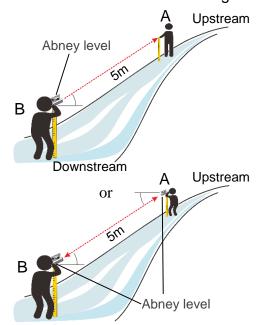

- Equipment:
- measuring tape Abney level

Find a five-meter interval by the measuring tape. Holding the Abney level on the top of meter rule, student B at downstream finds out the angle by observing the top of another meter ruler held by student A standing in upstream. If there are two groups in the same field site, one group measures the angle of elevation from downstream and another group measures the angle of depression from upstream.

| •              | Example              | Gradient |
|----------------|----------------------|----------|
| slope angle(•) | 20∘                  |          |
| tan (slope     | 0.36 (36%)           |          |
| angle)         |                      |          |
| Typical        | (0.36÷0.36 : 1÷0.36) |          |
| gradient       | 1 : 2.8              |          |
| Description of | Fairly steep         |          |
| steepness      |                      |          |

#### Description of slope steepness

| Slope angle (°) | Typical gradient | Description of steepness |
|-----------------|------------------|--------------------------|
| < 1°            |                  | Level                    |
| 1°-3°           | 1 in 60 (1.7%)   | Flat                     |

### PART B-WATER QUALITY

### [FIELDWORK]

According to <u>Table 1a</u> (p.12) and <u>3a</u> (p.13), assess the water quality at your study area by <u>observation</u>.

### Smell, Water Colour and Turbidity

#### Equipment: ✓ Sampling bottle (transparent)

White tile with "X" mark

#### Procedures:

- 1. Fill a transparent samling bottle with water sample and put it on a while tile with "X" mark.
- 2. Smell the water sample and observe the water colour.
- 3. View the "X" mark from the top of the transparent sampling bottle to determine water turbidity.
- 4. Assess the smell, water colour and turbidity of the river by using 4-point scale in Table 1a (p.12) and 3a (p.13).

#### Floating Matters, Green Algae and Sewage Fungi

Procedures:

- 1. Referring to figure 5, observe if there are any floating matters, green algae and sewage fungi in the river.
- 2. Assess the water quality by using 4-point scale in Table 1a (p.12) and 3a (p.13).
- ↓ Figure 5: Examples of floating matters, green algae and sewage fungi.

What should you pay attention when using 4-point scale?

Field Studies courses for SS Geography 2024-25

#### 影 明愛陳震夏郊野學園 Caritas Chan Chun Ha Field Studies Centre

According to <u>Table 2a</u> (p.12) and <u>4a</u> (p.13), assess the water chemical and biological properties at your study area by <u>measurement</u> and <u>laboratory work (refer to p.11)</u>.

## Salinity, Nutrient and E.coli (water sampling for laboratory work)

Equipment: ✓ Sampling bottle (100ml)

Procedures:

- 1. Immerse the samplong bottle with its mouth placed in the opposite direction of water flow. (*or collect water sample by a bucket*)
- 2. After filling up the 100ml sampling bottle, screw the lid of the bottle tightly before taking it out of water.
- 3. Invert the sampling bottle to check whether there is air bubble or leakage.

# Total Suspended Solids (TSS) (filtration for laboratory work)

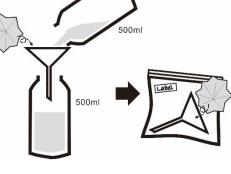

Equipment: 🗸 bucket 🖌 sampling bottle (500ml) 🖌 filter funnel with filter paper

Procedures:

- 1. Weigh a pre-dried filter paper.
- 2. Collect water by using a bucket. Fill up a 500ml sampling bottle.
- 3. Filter 500ml water sample into another 500ml sampling bottle by using a filter funnel with a filter paper.
- 4. Put the <u>filter funnel with filter paper</u> into a zip bag after filtration.

Maximize the surface area of the filter paper during filtration.

Invert the sampling bottle several times before filtration.

100ml

# pH value and Conductivity

P.S.

0 0

Equipment: ✓ conductivity meter and pH meter

Procedures:

- 1. Insert the pH and conductivity meter into the water sample. Stir it gently.
- 2. Wait until the reading becomes steady. Complete Table 2a (p.12) and 4a (p.13).

## Dissolved oxygen (DO)

Equipment: ✓ DO meter (shared)

Procedures:

- 1. Insert the dissolved oxygen meter into the water sample of the100ml plastic bottle.
- 2. Wait until the reading becomes steady. Complete Table 2a (p.12) and 4a (p.13).

Difficulties in collecting data (if any):

100ml bottle

### [LABORATORY WORK]

### **4** Salinity Test

Equipment: ✓ salinity meter

Procedures:

- 1. Insert the salinity meter into the water sample.
- 2. Wait until the reading becomes steady. Complete Table 2a (p.12) and 4a (p.13).

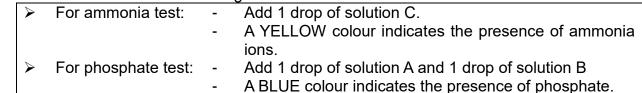

### Nutrient Test: Ammonia & Phosphate

Equipment: 🗸 dropper 🗸 cuvette 🗸 spectrophotometer

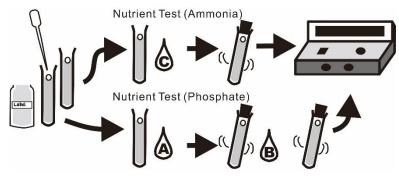

✓ solution A (ammonium molybdate / H2SO4 solution), B (5% stannous chloride solution) and C (Nessler's reagent)

Procedures:

- 1. Pipette the water sample into a cuvette until it reaches the white mark.
- 2. Add solution into the cuvette. Agitate the mixture.

3. Measure the concentration of ammonia/phosphate by using the spectrophotometer and the corresponding graph provided. Complete Table 2a (p.12) and 4a (p.13).

## ↓ <u>E. Coli Test</u>

Equipment: 🗸 petri dish 🗸 syringe 🗸 oven

Procedures:

- 1. Use a syringe to place 1 ml of water sample onto the middle of the petri dish samples will self-diffuse evenly over the whole plate.
- 2. Incubate the plate in a  $35^{\circ}C(+ / 2^{\circ}C)$  oven for 16 hours.
- 3. Count the number of colonies (*E. coil* forms blue colonies). Complete Table 2a (p.12) and 4aa (p.13).

#### Cfu\*/ 100ml = no. of blue colonies x 100

\*Cfu: colony-forming-unit

# Total suspended solids (TSS)

Equipment:  $\checkmark$  evaporating dish  $\checkmark$  forceps  $\checkmark$  oven

Procedures:

- 1. Use forceps to place the used filter paper into an evaporating dish carefully.
- 2. Dry in a 105°C oven overnight and reweigh. Complete Table 2a (p.12) and 4a (p.13).

ppm = mg/L = [the increase in mass (g)] × 2 × 1000

ppm=part per million

✓ balanc

1ml

### **Stage 3: Data Processing & Presentation**

- 1. Draw the channel cross section(p.6) and calculate the cross sectional area and discharge(p.6)
- 2. Calculate the average velocity of channel(p.7)
- 3. Calculate the channel gradient(p.7)
- 4. Calculate the mean diameter of bed load(p.8)

5. Fill in the data summary of fluvial process & characteristics of River Silver (p.16)

- 6. Fill in the data summary of water quality of River Silver and Wang Tong (p.17)
- 7. Calculate the degree of water pollution in River Silver and Wang Tong (p.18)

### The degree of water pollution

According to the assessment results in table 1b and table 2b, use weighted average assessment score (WAAS) to evaluate the degree of water pollution in your field sites and share the data with other groups.

Degree of Pollution

| WAAS        | Pollution Magnitude |
|-------------|---------------------|
| 0.00 - 1.50 | Clean               |
| 1.51 - 3.00 | Slightly Polluted   |
| 3.01 - 4.50 | Moderately Polluted |
| 4.51 - 6.00 | Severely Polluted   |

| River               | Site | Direction of<br>water flow | WAAS | Pollution Magnitude |
|---------------------|------|----------------------------|------|---------------------|
| <b>River Silver</b> | Α    |                            |      |                     |
|                     | В    |                            |      |                     |
|                     | С    |                            |      |                     |
|                     | D    | V                          |      |                     |
| Wang Tong           | E    |                            |      |                     |

|                     | G    |                            |      |                     |
|                     | Н    | V                          |      |                     |

# **Stage 4: Interpretation & Conclusion**

- 1. With reference to the data summary of fluvial process & characteristics of River Silver (p.16), explain whether the hypotheses in p.2 are correct:
  - a) gradient
  - b) average velocity
  - c) channel width
  - d) channel average depth
  - e) size of bed load
- 2. Referring to the data summary of water quality (p.17) and the Weighted Average Assessment Score (WAAS) (p. 18) of River Silver and Wang Tong River, evaluate the validity of the following statement:

"The degree of river pollution increases downstream in the study area.".

- 3. Identify the major changes of land use in study area by using Mui Wo's aerial photos of different years. Explain how these changes affect the water quality of both River Silver and Wang Tong River.
- 4. Compare and explain the locations of channelization in River Silver and Wang Tong River.

# Stage 5: Evaluation

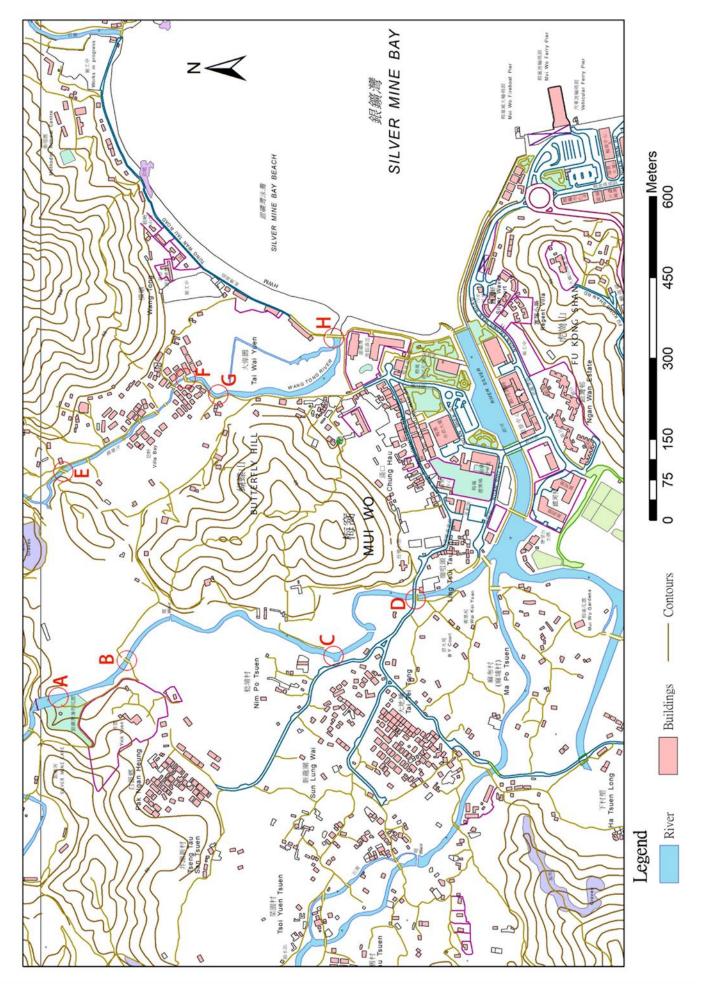

- 1. Does the data collected respond to the enquiry question?
  - i. Analyze the drawbacks of the data collection process and how such drawbacks affect the validity and reliability of data.
  - ii. Propose ways to tackle the influences brought by the above drawbacks.

| Factors affecting the data   | Suggestion for<br>improvement |  |
|--|-------------------------------|--|
| <ul> <li>Fieldwork date/ time</li> <li>Fieldwork date and time representative?</li> <li>Any impact by today's weather condition?</li> <li>Field site/ study area</li> <li>Field sites match with research topic?</li> <li>Field study area adequate?</li> </ul>  |                               |  |
| <ul> <li>Location of data collection<br/>(Sampling)</li> <li>Sampling method in choosing<br/>field site appropriate?</li> <li>Location of measurement<br/>representative?</li> <li>Sample size sufficient?</li> </ul>  |                               |  |
| <ul> <li>Data collection items/ methods</li> <li>Data collection items adequate to respond the enquiry questions?</li> <li>Are the data obtained from the data collection method(s) objective and without bias?</li> <li>Any inadequacy about the equipment/ instruments?</li> <li>Measurer using the equipment/ instruments correctly?</li> </ul> |                               |  |

- 2. Point out one advantage and one limitation for conducting field work today on water quality in River Silver and Wang Tong River. How can you alleviate this limitation?
- 3. Other than the data collected in this fieldwork, what other data and information would help for the further investigate the river environment and pollution. Explain your answer.

#### Homework:

After the fieldwork, please organize this fieldwork experience in field trip diary on p.22-23, as a reference for the revision of field-based question.

#### > For deeper learning or further study, I suggest modify the following aspects.

|  | Suggestion | (give examples) |
|--|------------|-----------------|
| Key point of fieldwork/ topic                      |            |                 |
| Data to be collected and method of data collection |            |                 |
| Date and time of fieldwork                         |            |                 |
| Field site   |            |                 |

# Data collection methods

| Data collection<br>methods   | Explanations  | Examples  |  |  |  |
|------------------------------|---|---|--|--|--|
| A) Observation               | <ul> <li>Using sensory observation to explore the details of research subject (people, things or<br/>environment) in a purposive and planned way. Data are recorded using text, photos, sketch,<br/>map, etc. (Refer to other data collection methods listed below)</li> </ul>  | <ul> <li>Identification of surrounding<br/>environmental of a field site</li> </ul>   |  |  |  |
| B) Measurement               | • To estimate or measure the physical quantity of the research subject. It usually requires the use of equipment or tools. Data are usually shown in certain standard, weights or measures.   | • Measurement of the width of street and the building height  |  |  |  |
| C) Counting                  | • To record the number of occurrence of a single item.  | • Statistics of pedestrian flow at the pier   |  |  |  |
| D) Category                  | <ul> <li>To classify based on the nature, characteristics and uses:</li> <li>to group the same or similar things;</li> <li>to separate different things.</li> </ul>   | <ul> <li>Types of goods sold in supermarket</li> <li>Customers (serving local residents and tourists) of different shops</li> </ul>   |  |  |  |
| E) Distribution<br>(mapping) | <ul> <li>To group similar things according to the research topic (similar to "D. Category");</li> <li>Only suitable for spatial representation (different from category);</li> <li>Useful in showing the mode of occurrence of research subject in a complex environment.</li> </ul>  | <ul> <li>Distribution of shops selling big fish<br/>balls in Cheung Chau</li> </ul>   |  |  |  |
| F) Scoring                   | <ul> <li>To quantify abstract or subjective concepts;</li> <li>To merge various data for easy comparison;</li> <li>Scoring items should include different aspects.</li> </ul>   | <ul> <li>Risk index of Cheung Chau to natural<br/>hazards</li> <li>Air Quality Health Index (AQHI)</li> </ul>   |  |  |  |
| G) Field sketching           | • To make simplified drawing of the field site to show what the data collectors observed.<br>Annotations related to the research subject are added to provide key feature or additional information.  | <ul> <li>Draw the characteristics and formation<br/>of weathering landforms</li> </ul>  |  |  |  |
| H) Questionnaire             | <ul> <li>Forms: face-to-face, telephone, written, etc.;</li> <li>Using questionnaire to understand the opinion of research subject;</li> <li>Larger sample size than "I. in-depth interview";</li> <li>Mainly closed questions (with options available).</li> <li>To collect information by questioning;</li> <li>To obtain information which is</li> </ul>                 | <ul> <li>The major reasons for tourists to visit<br/>Cheung Chau</li> <li>The level of satisfaction among<br/>residents regarding the revitalization<br/>project</li> </ul> |  |  |  |
| l) In-depth<br>Interview     | <ul> <li>To obtain information through face-to-face/ telephone interview;</li> <li>Smaller sample size than "H. Questionnaire";</li> <li>Mainly open questions and forthcoming questions will change upon the answer of respondents.</li> <li>difficult to be obtained through observations;</li> <li>To understand the rationales and opinions of interviewees.</li> </ul> | <ul> <li>Opinions of District Council members<br/>on the future development of that<br/>district</li> </ul>   |  |  |  |

# **Sampling Methods**

| Sampling Methods |  |   |   |   |   |  |  |  |
|------------------|--|---|---|---|---|--|--|--|
|                  | Probabilistic  | sampling methods  |   | Non-probabili   | stic sampling metho   | ods  |  |  |
|                  |  |   |   | <ul> <li>Size of population might not be relevant to the research objective;</li> <li>Chance of individual being selected is unknown;</li> <li>Representativeness of the results depends on the judgment of researcher in sample selection (Such as the correlation between samples and research targets).</li> </ul> |   |  |  |  |
| Methods          | Simple random<br>Sampling  | Systematic sampling   | Stratified<br>Sampling  | Quota<br>Sampling   | Convenience<br>Sampling   | Purposive<br>sampling  |  |  |
|                  | (簡單隨機抽樣)   | (系統抽樣)  | (分層抽樣)  | (配額抽樣/定額抽樣)   | (便利抽樣/方便抽樣)   | (立意抽樣)   |  |  |
| Explanations     | To select sample from<br>the <u>whole population</u><br><u>randomly</u> . (using<br>computer program,<br>bamboo slip or<br>random number<br>table) | Each member of the<br>whole population is<br>sequentially<br>numbered, then<br>selected according to<br>a <u>fixed, periodic</u><br><u>interval</u> . | The whole population<br>are classified according<br>to the variable and<br>divided into separate<br>stratum. Then samples<br>are selected randomly<br>by proportion from each<br>stratum. | The whole population<br>are classified according<br>to the variable and<br>divided into separate<br>stratum.<br>Then desired number<br>(quota) of samples are<br>selected from each<br>stratum.   | Research subjects are<br>selected due to<br>convenience of<br>recruitment.  | Samples are selected<br>according to research<br>objectives and special<br>requirements.                           |  |  |
| Examples         | To choose a certain<br>number of students<br>to conduct<br>questionnaires/<br>surveys according to<br>the class number.                            | To measure the noise<br>level of a street in a<br>regular interval.   | To group buildings<br>according to their ages<br>(e.g. above or below<br>50), and select a certain<br>number of buildings in<br>each group randomly.                                      | To select a certain<br>number of male and<br>female customers, then<br>record the amount spent<br>in a shop.  | To interview a certain<br>number of relatives who<br>work in mainland China<br>To interview a certain<br>number of passersby on<br>the street | To conduct an in-depth<br>interview with a district<br>councilor about the<br>social problems of that<br>district. |  |  |
| Remarks          | Suitable for small<br>population and few<br>variations among<br>samples (for relevant<br>research objectives).                                     | Suitable for large<br>population (hidden<br>cyclic ordering which<br>may affect the<br>representativeness of<br>data).                                | Effectively show the relationship / effect between variables.   | Effectively show the<br>relationship / effect of<br>variables, but the<br>characteristics and size<br>of samples are judged<br>subjectively.  | Should not generalize<br>the data to larger<br>population   | Suitable for qualitative<br>research (data is easily<br>influenced by the<br>subjective judgment of<br>researcher) |  |  |
